Hi Bryn,

After auditing the entire codebase against all 4 previous guides, I found 14 things that were missing or incomplete. This guide covers ALL of them.

What was missing:

1. Google Apps Script — The email automation system (ticker, reminders, delete, homework) was never documented. Includes example Apps Script code you can paste directly.
2. TMU Academic Calendar — The iCal feed env var (TMU_ICAL_URL) wasn't mentioned.
3. OpenAI Base URL — The Integration Guide said to change 1 file, but actually 5 files need updating (audio, image, chat, and 2 places in routes.ts).
4. Object Storage Replacement — Full implementation code for a local file system replacement (server/localFileStorage.ts) you can drop in as a replacement.
5. Replit-Specific Environment Variables — 7 variables that exist on Replit but not on a Pi, and what to do about each.
6. Self-Ping Keep-Alive — An unnecessary background process you can remove on the Pi.
7. Complete Background Tasks List — All 8 scheduled processes with

intervals and what they do.

8. Webhook Auth Code (5747) — Security issue: hardcoded auth code needs to be changed to a strong secret.

9. Replit AI Integrations — Full list of all 6 files that need the OpenAI env var changes (not just 1).

10. Uppy File Upload Widget — How uploads work and what changes with local storage.

11. .spotify-token.json — Token file that auto-creates on first login.

12. Replit Vite Plugins — 3 dev dependencies that may cause build errors on the Pi, and how to remove them.

13. Session Storage (connect-pg-simple) — Session table that may need manual creation.

14. Edge TTS — Two different implementations (Python + Node.js), both needed.

PLUS: A 30-item master checklist at the bottom covering everything from all 5 guides in order.

This should be everything. You now have complete documentation for your entire app.

Best,
Dashboard App
